Typing Speed Test Analyzer - Report

Objective:

The goal was to calculate typing speed, accuracy, and mistakes for multiple users using linked lists.

Methodology:

- Linked lists were used to store words from files.
- Accuracy was calculated by comparing user typed words with pattern words.
- Speed was calculated as (correct words) / (time in seconds).
- Mistakes were tracked to find the user with the most incorrect words.

Results:

The program prints accuracy, typing speed sorted from slowest to fastest,
and the list of incorrect words for the user with the most errors.

Conclusion:

Linked lists efficiently handle variable-length text input, and the program
successfully provides the desired metrics for typing analysis.
